# The 3-Minute Airway Checklist

A quick-reference for transitioning from clinical observation to a life-changing conversation.

## 1 Clinical Red Flags (The Observation)

During your routine exam, look for these key indicators of potential airway issues:

- **Tooth Wear:** Moderate to severe occlusal attrition (grinding).
- **Soft Tissue:** Scalloped tongue or Mallampati Class III–IV.
- **Structure:** High/narrow palate or lower anterior crowding.
- **Profile:** Retrognathic jaw (recessed mandible).

---

## 2 The Bridge (The Conversation)

Connect your clinical findings to the patient's daily life.

### THE OPENING

*"I'm noticing a couple of things in your mouth that we sometimes see in patients who aren't breathing optimally during sleep. Can I ask you a few quick questions about that?"*

### THE QUICK SCREEN

- ☐ Do you feel rested when you wake up?
- ☐ Has anyone ever told you that you snore?
- ☐ Do you wake up with headaches/dry mouth?
- ☐ Have you ever had a formal sleep study?

---

## 3 The Solution (The Ring)

Offer a low-friction path to clarity. Patients want to feel better; you are providing the tool to get them there.

### THE PITCH

*"We can screen this easily. You'll take home a small ring to wear while you sleep for one night. A sleep physician reviews the data virtually to see if a custom device—a comfortable, quiet alternative to a CPAP—could help you finally wake up rested."*

### THE ACTION

*"Would you like to take the ring home today?"*

Individual results may vary and are not guaranteed. An evaluation is required to determine whether you are a candidate for treatment and what options may be appropriate. If you have symptoms of a sleep disorder, talk with a qualified healthcare provider about appropriate evaluation. Insurance coverage and out-of-pocket costs vary by plan; preauthorization and medical-necessity requirements may apply.
